

[Opening]

Good morning everybody,

Today I'm here to explain about our project called **Tiipstr**.

Tiipstr is not just another social media app — it's a platform built to bring **truth and transparency** into the world of social networking.

[Introduction]

So, what makes Tiipstr different?

Well, unlike platforms that are focused only on sharing photos or videos, Tiipstr allows users to **review each other**.

You can give reviews using **star ratings, narratives, and even multimedia uploads**.

For example, you could review your customer, your neighbor, your friend, a teacher, a coach, or even your business partner.

This way, before starting any kind of relationship — personal, professional, or business — you already know what others think of that person.

This makes interactions **safer, more transparent, and more trustworthy**.

[Tech Stack]

Now let me talk about the **technology stack** we used to build Tiipstr.

- On the **frontend**, we're using **React.js** for a fast and responsive user interface.
- On the **backend**, we're using **Java Spring Boot**, which provides strong performance and security.
- For the **database**, we've chosen **MySQL** for reliable data storage.
- And for **deployment**, we're hosting everything on **AWS** to ensure scalability and availability.

In addition to that, we've integrated several third-party tools and services:

- **Authorize.Net** for payment gateway integration
- **Apache Kafka** for real-time user-to-user chat
- **WebSockets** for live notifications and updates
- **Persona** for KYC verification
- **Plaid** for connecting bank accounts securely
- **AWS Cognito** for authentication and application security
- **HubSpot** for CRM integration

So, as you can see, we've chosen a strong and modern stack that can handle growth and complexity.

[User Onboarding & Plans]

Now, let me explain how a user comes into Tiipstr.

When a new user signs up, they can use either their email or their phone number.

By default, they start with a **basic plan**.

This basic plan is **completely free** and includes features like:

- Adding reviews
- Viewing reviews
- Liking or disliking reviews
- Updating their profile
- Sharing reviews to external social media platforms like Facebook, Instagram, LinkedIn, or X

But Tiipstr also offers a range of **advanced plans**:

- **Monitor, Engage, Control, Professional, Business, Business Plus, and Enterprise**
These plans are available in both **monthly and yearly** subscriptions, and each plan unlocks **additional powerful features**.
-

[Profiles]

One of the unique aspects of Tiipstr is that it supports **different types of profiles** under the same login.

- **Personal Profile:** This helps you understand people in your personal life. Before you start a friendship or relationship, you can see what others think about them. It's like a reputation check that keeps you safe.
- **Professional Profile:** This is focused on the workplace. For example, if you're hiring an employee, you can see their reviews. Or if you're about to join a new company, you can even see reviews about your potential boss. This can help avoid wrong career moves.
- **Business Profile:** Here, companies can know more about their customers before providing goods or services. Businesses can use Tiipstr scores to decide whether to take on certain clients.

- **Association Profile:** This allows associations or organizations to build credibility and manage how people see them on the platform.

And the best part is — you don't need separate accounts. You can switch between these profiles with a single login.

[Features]

Now let's look at some of the key features that make Tiipstr unique.

- **TiipTok:** This is like our own social media engine. Here, users can post photos and videos, just like on Instagram or Facebook. But unlike other platforms, users have more control. They can decide **who can see their posts and who can comment** on them.
 - **Chat & Groups:** Using Kafka and WebSockets, Tiipstr supports both **one-to-one chat** and **group chat**, all in real time.
 - **X-Change:** This is one of our most innovative features. In normal social media apps, the platform keeps 100% of the advertising revenue. But in Tiipstr, we let users **earn money** by engaging with ads.
 - Users can turn this feature on or off.
 - They can even set their own rates for actions like watching or posting.
 - Advertisers benefit too, because they get 100% attribution and efficiency.
 - **My Marketplace:** A built-in **e-commerce portal** where KYC-verified users can display and sell products. Other users can purchase and leave ratings.
 - **My Services:** Similar to Marketplace, but instead of products, users can offer services. These services are also reviewable and rateable, adding transparency.
 - **Unique QR Codes:** Every profile has its own unique QR code, which makes it easy to share and validate identities.
-

[Security & Wallet]

Security is at the core of Tiipstr.

Unlike many platforms, we **don't allow unauthorized users**.

Every single user is **KYC verified**.

Once verified, users get a **digital wallet** linked to their bank account. With this wallet, they can:

- Pay for subscriptions

- Buy products in Marketplace
- Avail services in My Services
- Transfer money to other Tiipstr users
- And even earn from the X-Change program

This means Tiipstr is not just a social media app — it's also a **financial ecosystem**.

[Future Vision]

Tiipstr is continuously evolving.

In the future, we plan to integrate **AI-powered tools** to make the platform smarter. We're also looking to add even more features to improve **security, monetization, and user engagement**.

[Closing]

So, in summary, Tiipstr is a platform that combines **social networking, transparency, business tools, e-commerce, services, and finance** all into one ecosystem.

It's built to make online interactions **safe, trustworthy, and rewarding**.

Thank you for listening.

If anyone has questions, I'd be happy to explain more.
