

TiipTok

Feature Requirements & Minimum Capabilities

TiipTok is the social media engine that is embedded in tiipstr. It is where a user (Personal Profile) can create and post content similar to Facebook, Twitter, Instagram, etc. It will need to support initial posts, including text, images, video, etc.

1. The score of the commenter has to be prominently displayed at all times; not just when you hover over the commenter's name. See the above example.
2. Clicking on a commenter's name will navigate you to that tiipstr's View User page.
3. A view/commenter access setting (for TiipTok) should be as follows: This should be a setting in Preferences:
 - i. All KYC tiipstrs can view and comment OR
 - ii. All KYC tiipstrs can view but not comment AND/OR
 - iii. All Approved tiipstrs can view, post, and comment.
4. We need to establish a mechanism whereby a tiipstr can approve of another tiipstr's ability to view/comment on their TiipTok feed. This can be unilaterally approved by a tiipstr or upon a request.
 - a. A tiipstr can navigate to another tiipstr's View User page and click a button that grants that tiipstr access to view and comment on the approving tiipstr's TiipTok feed; and/or,
 - b. A tiipstr can click on a button that asks the other tiipstr for approval to view and comment on their TiipTok feed. In this scenario, the tiipstr that has been asked for approval of another tiipstr to view and comment on their TiipTok feed can select ACCEPT OR DENY Request.
 - i. These friend/TiipTok requests could appear as messages in the Inbox - with the approve/deny request action button.

- c. We need to make some designation or left navigation item called "Friends."
All tiipstrs I have approved to view and comment on my TiipTok feed would be in this.
 - i. If they have selected either of their Public setting options for their TiipTok approval, only the tiipstrs they manually approved would show in this Friends tab.
